

Companion Studio

Consumer-friendly app for creating private, portable, guardrailed AI companions

LOCAL-FIRST MVP

Product promise

Create AI companions you can trust - designed to work locally first, with visible safety boundaries and user-controlled memory.

What it is

A goal-first companion studio. Users choose what they need help with, review the suggested companion, then start a private/local session. The technical prompt, router, model choice and guardrails stay behind a simple consumer experience.

Goal Companion Boundaries Local chat Summary

Goal-first UX

Users start with a need, not a prompt or model setting.

Local/offline first

Private conversations run locally whenever possible.

Safety boundaries

Each companion clearly shows what it can and cannot do.

Portable personas

Companions can be saved, reused and exported as profiles.

Age-aware mode

Child, teen and adult settings shape safe behavior.

Smart handoff

The app can suggest a better companion when the need changes.

MVP user flow

Why this flow: it proves the central thesis quickly - users can go from a vague need to a suitable, bounded, reusable AI companion without touching system prompts or model settings.

Underlying principles / why they matter

Start from goals, not prompts

- Reduces cognitive load and makes advanced AI behavior accessible to non-technical users.

Boundaries before chat

- Turns safety into a visible product feature instead of a hidden policy layer.

Companions are reusable

The product becomes a personal library, not a one-off chatbot session.

Local by default

Supports privacy, offline use, reduced API cost and a stronger trust story.

Memory must be explicit

Users can see whether anything is saved, reused or deleted.

Cloud requires consent

- Preserves the local-first promise and makes external data transfer transparent.
